

What is a Crop Factor?

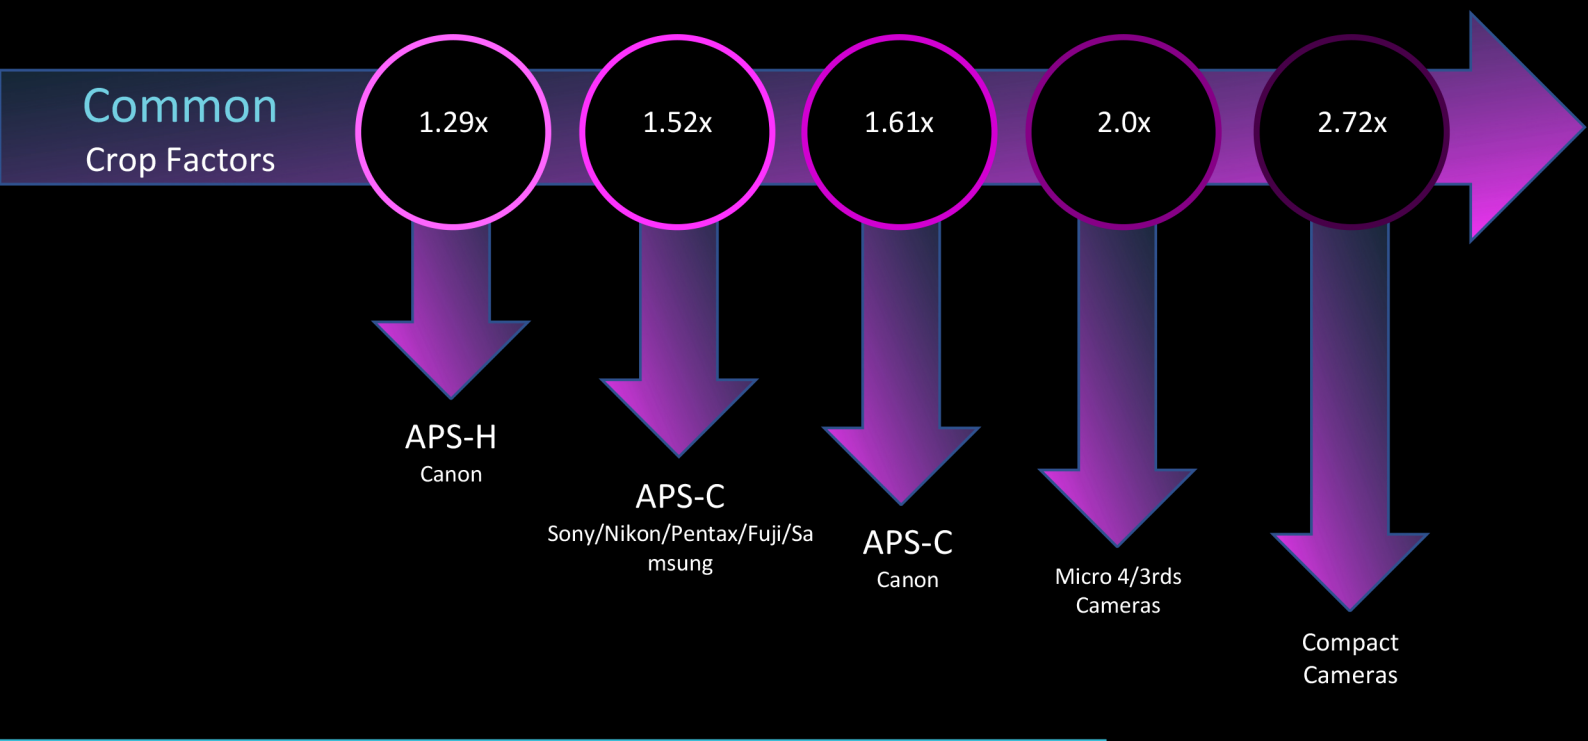

Quick-fire guide to understanding your camera's crop factor and how it effects your photos.

All cameras that don't have a full-frame sensor are referred to as cropped sensors. It means they are smaller than a full sized one.

The crop factor of your camera will change the focal length of any lens. A 50mm lens will never be truly 50mm on a cropped sensor.

FIND OUT YOUR CAMERA'S CROP FACTOR

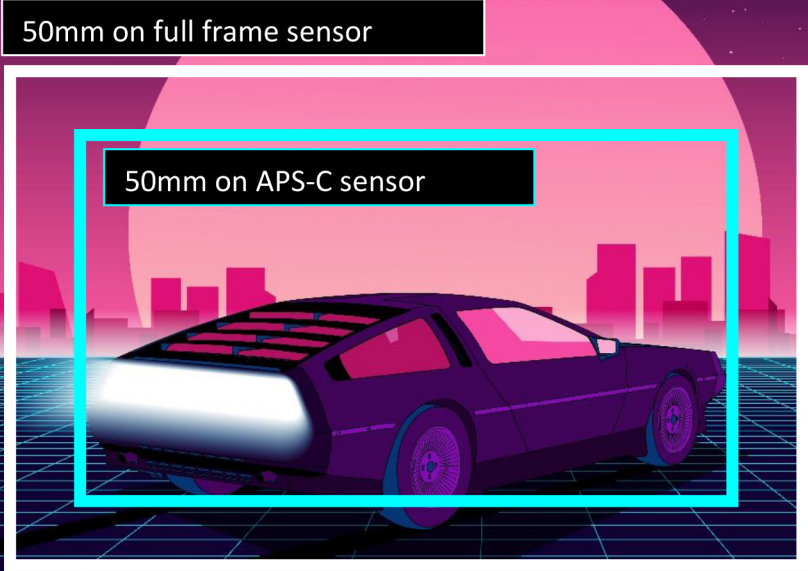

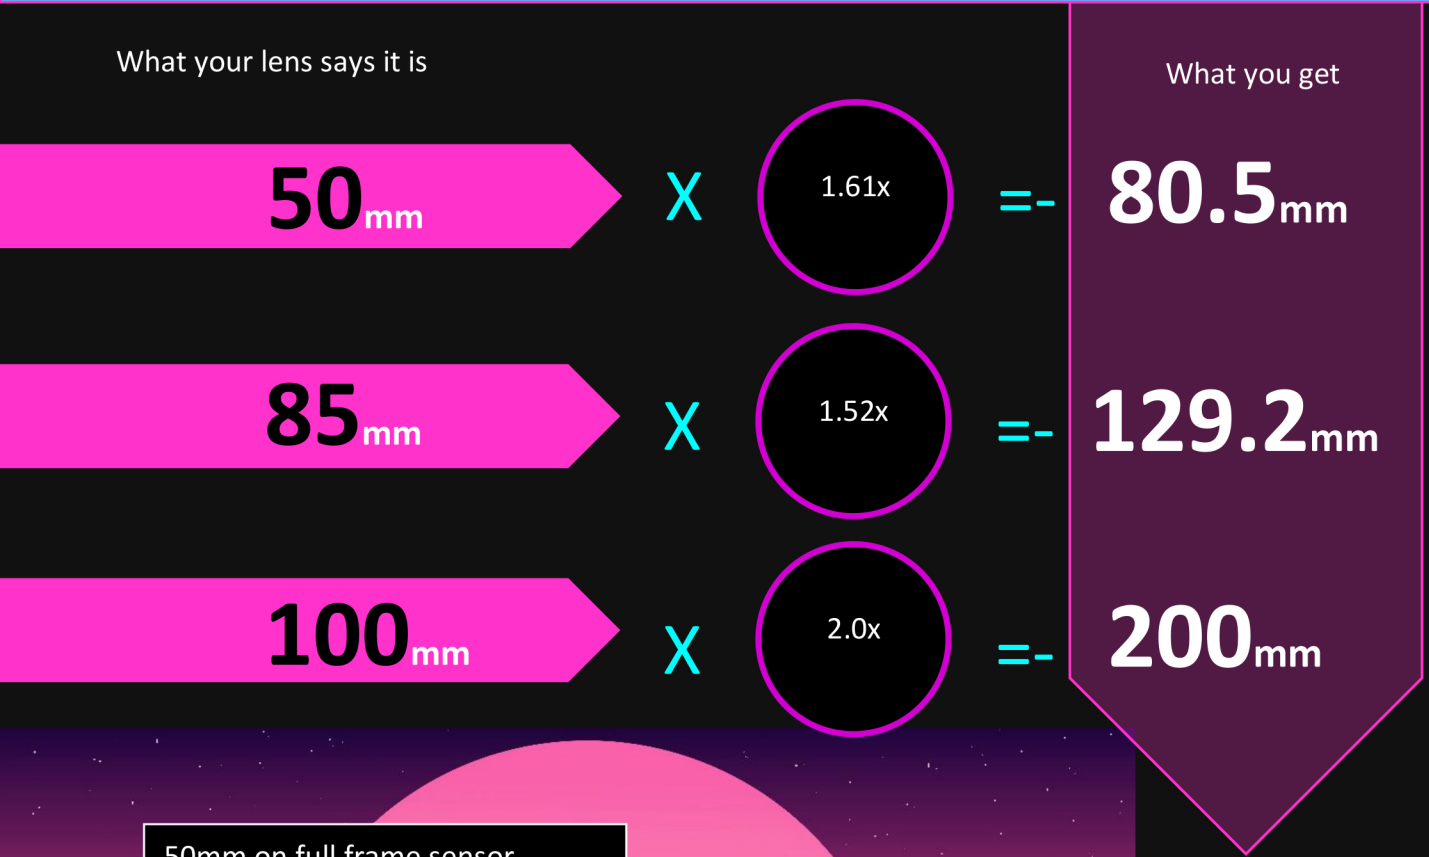

This is how to work out lens' **true focal length**

MULTIPLY
your focal length **X** camera's crop factor

SEE IT IN PRACTICE

Same goes with zoom lenses
18-55mm on **APS-C**
actually, gives you a
27.36-83.6mm lens
